

BURNETT MEDICAL CENTRE

WEBSITE & ONLINE BOOKINGS
NOW AVAILABLE AT:

www.burnettmedical.com.au

15 Barolin Street
Bundaberg 4670

P: 4151 2608 (all hours)

E: clinical@burnettmedical.com.au

Dr Ayo Adeniji

Dr Drew Speight

Dr Mesbah Ahmed

Dr Ziaur Rahman

Dr Steven Foster

Dr Kathryn Lowrie (female doctor)

PRACTICE MANAGER – Heidie Grimson

RECEPTIONISTS – Deemeta, Katie, Kerri, Elise, Jessie-Ann and Jackie

NURSES – Tracy, Leanne and Carol

Our nurses have the experience and training to provide a wide range of services. Refer Practice Nurse Clinics on back page.

BURNETT MEDICAL CENTRE is a family medical practice providing quality care. Our services include:

- Minor surgery including skin cancers
- Vaccinations
- Preventative health checks
- Practice Nurse clinics (see back page)
- Home visits (within 10km radius of clinic) and nursing home care
- Private hospital in-patient treatment

DIABETES EDUCATORS

Janelle Anderson and Pat A'Bell

CONSULTATIONS BY APPOINTMENT

Monday – Friday: 8:00am–6:00pm

Saturday: 8:00am–12:00noon

Phone 4151 2608 to make an appointment.

Please tell the receptionist if the appointment is for a special reason – eg, Pap smear, ear syringing, drivers or work medical, insurance or Centrelink forms. Longer appointments are available for complex medical problems.

AFTER HOURS SERVICE

After hours, please contact House Call Doctor on 13 55 66 to arrange a home visit. Alternatively, contact the Friendly Society After Hours Medical Service, 19 Bingera Street, Bundaberg, phone: 4331 1777 – open until 11pm every day.

CANCELLATION POLICY

If you need to cancel a general appointment, we require 2 hours notice otherwise a cancellation fee may apply. For the cancellation of long appointments, procedures, SIPS etc, 24 hours' notice is required or a \$60 cancellation fee applies.

RECALL REMINDER REGISTER

This clinic operates a recall reminder register. If you do not wish to be part of this, then please let your doctor know.

CODE OF CONDUCT

Please refer to the clinic code of conduct at the entrance to the centre.

NOVEMBER 2017

Detecting melanoma early

With summer now on the horizon, many of us will be looking forward to spending time outdoors in the countryside or at the beach.

Those long, sun-filled days awaken our senses, but they also re-awaken the need to protect our skin. Over recent years, messages around sun protection have been widespread. Whilst they seem to be having an impact, particularly in the Southern Hemisphere, Australia and New Zealand continue to have the highest rates of melanoma in the world. It is estimated that in 2017 almost 14,000 Australians will be diagnosed with the condition.

We are all aware of the basic messages: avoid the sun where possible; cover up with a t-shirt and hat; and regularly apply sunscreen. We know these measures work, and the results are starting to be observed in a levelling off of melanoma rates, especially amongst the young. Yet many individuals continue to ignore the messages, with some polls suggesting only 7% of people regularly and reliably use sunscreen.

If we have done our best to protect ourselves from sunburn, is there anything we can do to pick up melanoma early, when it is often straightforward to treat? We know that the earlier a melanoma is detected, the better our chances of surviving it. Since we can see the skin, detecting new tumours should in theory be very easy. However, we need to know what we are looking for. One thing which has been poorly understood about melanoma to date is whether most tumours develop from existing moles or as new growths. Skin self-examination is recommended by many medical professionals and organisations; and commercially sourced 'mole-mapping' is increasingly available. However, experts and published papers have had widely

differing opinions on how tumours develop, and therefore what are the most important things to check for. Different research groups have quoted figures of anywhere between 7 and 70% when estimating what proportion of melanomas occur as the more easily detectable 'new' growths.

A new review published in the Journal of the American Association of Dermatology has attempted to bring some clarity to this question. They brought together the results of research involving over 20,000 tumours, and found that over 70% started as new growths. This finding gives us valuable information, really bringing home the importance of regular skin self-examination, as well as the need to act quickly on any new findings. Even a small lesion which has not been there before should be taken seriously, and medical advice sought at an early stage. Changes such as an existing mole becoming itchy, changing colour or bleeding may also need investigation.

Whilst at present there is no formal screening programme in place for melanoma, experts suggest we should be self-examining at least once a year, and asking for help in checking hard-to-see areas such as the back. There is growing evidence that regular skin examination increases the proportion of tumours which are detected at an early and treatable stage.

The bottom line remains that we should all protect ourselves by seeking the shade, covering up and regularly applying sunscreen. Regular skin self-examination is the next key to rapidly detect new lesions; followed by seeking medical help if any are found. Following these simple steps might save your life.

Fresh hope for children with severe peanut allergy

A report published this year signals a potential breakthrough in the treatment of severe peanut allergy, and paves the way to finding a cure for other life-threatening allergies.

As a parent, having a child with a peanut allergy can be extremely stressful. It means scrutinising every label when buying food, ensuring that all friends and family taking care of your precious offspring are also extra-vigilant, and carrying an EpiPen (a medical device for the immediate administration of medicine to

counteract severe allergic reaction) with you at all times. Travelling away from home or eating out can cause an extra headache in trying to guarantee your child's safety, and may be avoided for this reason. Hope is at hand, however. A study published in August 2017 by the Murdoch Children's Research Institute indicates that a cure for peanut allergy may have been found.

According to the Institute, as many as 10% of 12-month-old children have a food allergy. It isn't fully known why some children develop allergies while others don't, although factors such as genetics and environment are both thought to play a part. Fortunately, most allergic reactions in children are mild, with symptoms such as a runny nose, itchy eyes and irritated skin, all of which can be managed easily with over-the-counter antihistamines.

Some allergic reactions however, such as those resulting from a peanut allergy, can cause anaphylactic shock, which is life-threatening. This is where more than one body system reacts to the food as a foreign invader, causing swelling of the mouth and throat, breathing problems, and in some cases, loss of consciousness and death.

Researchers looking at how to reduce the number of deaths associated with this allergy conducted a trial in 2015 to examine a new form of treatment, and the results were published in the Journal of Allergy and Clinical Immunotherapy. The children taking part in the trial were given a combination of probiotics with peanut protein in gradually increasing amounts for 18 months. The hope was that it would 're-programme' the body to recognise the peanuts as harmless, and therefore shut down the potentially life-threatening immune response. And, so far, so good. A follow-up study published in August 2017 in The Lancet: Child & Adolescent Health journal showed that the trial had been tremendously successful. The report showed that 80% of the children who received the therapy were consistently able to tolerate peanuts 4 years later, as compared with only 4% of the children who were on the placebo.

Although further, larger trials are needed, the results represent a significant leap forward for the treatment of this serious condition, and could also lead to breakthroughs in the treatments of other severe allergies, providing hope for thousands of families.

MOROCCAN CHICKEN SALAD

Spice rub

- 1 tsp ground ginger
- 1 tsp cumin
- ½ tsp ground pepper
- ½ tsp salt
- ½ tsp cinnamon
- ½ tsp cayenne or paprika
- ½ tsp allspice

Dressing

- ¼ C orange juice
- Zest of half an orange
- 2 T cider vinegar
- ¼ C olive oil
- 1 tsp sugar

- 2 chicken breast fillets
- 1 C Israeli couscous
- 1 can Chickpeas, drained
- 1 bag fresh baby spinach (or other green leaves)
- 1 C almonds, toasted
- 1 cup dried apricots, chopped

Method

Combine spice rub ingredients. Massage into chicken and leave to rest while preheating the oven to 180°C. Place on baking paper and cook for 25 minutes or until cooked through. Remove from oven and allow to rest for 10 minutes before slicing.

While the chicken is in the oven, prepare the couscous as per packet instructions. Drain and rinse in cold water.

Shake all the dressing ingredients together.

Gently toss all the ingredients in a bowl.

Serve and enjoy!

Time to get off the couch!

Getting out and doing exercise after years of doing none at all can be daunting. But it doesn't have to be. The key is to start slowly, and there is lots of help out there for you.

So you know you need to lose weight and do more exercise, and you want to be fitter, but the thought of putting on some trainers and going out for a run leaves you in a cold sweat. You don't even know where to start. If this is you, then an app developed by the NHS in the UK may be just the encouragement you need to swap your slippers for some running shoes.

The free app, called 'Couch to 5K' (C25K), is specifically designed for those who do little or no cardiovascular exercise, and believe they are unable to. The programme aims to get you from doing no exercise at all to running 5 kilometres – all within 9 weeks. A voice on the app guides you through each session, starting gently and slowly, and increasing on a weekly basis so that you learn to run safely and effectively. It's just like having a tiny personal trainer in your pocket. And this isn't the only option, there are a tonne of C25K-type apps now available, so you can choose the one that suits you best – just search for C25K in your app store.

The secret to the success of this type of programme is that it is achievable. Because each challenge comes in bite-sized chunks,

you can easily complete them. What's more, you will also gain a great sense of satisfaction as you pass each milestone, and you will soon see the benefits.

Not only does it get you fitter and healthier, it can also help with weight loss, stress relief and body image; reduce lethargy and increase energy levels. You won't be alone either – the NHS app, for example, has a forum on their website that includes plenty of advice from others on the same journey as you, so you can share your experiences and receive support.

The programmes are for everyone, young and old alike. And, the best part – running is free! All you need is a good pair of trainers and some comfy clothes.

A regular running plan can help you feel better physically, mentally and emotionally; and chances are once you complete the programme, you won't look back. And remember, even if you're slower than a tortoise, you're still faster than everyone still sitting on the couch.

Please consult your physician if you are experiencing any health issues that may affect your ability to do this form of exercise.

What to do if you are stung in the sea

Swimming in the sea is one of the pleasures of summertime, however, very occasionally something might unexpectedly sting us.

The most common stings come from jellyfish or sea urchins; and fortunately, for most of us, these are a painful annoyance rather than truly dangerous.

Very rarely a sting can be serious – either due to the animal encountered or because the individual is allergic to the sting. If the sting comes from an exceptionally large jellyfish, there are numerous stings, or the affected person suffers any signs of a severe reaction such as difficulty breathing, a rapid heart rate or swelling of the face or mouth, then emergency help should be sought.

For most of us, however, simple first aid measures can help reduce the pain of the sting. For both jellyfish and urchin stings, vinegar is known to be very beneficial. Sea urchin spines tend to get embedded in the skin; and trying to pull them out can often break them, leaving a portion hidden under the surface. Bathing the area with vinegar dissolves the spines, meaning they are

completely removed. Although it can take several tries to completely get rid of the sting, it is usually the most effective method.

A study in 2017 found that vinegar was also one of the most successful ways to reduce the pain of jellyfish stings. Warm packs and anti-inflammatory medication such as ibuprofen can also help reduce pain and swelling.

Other commonly cited remedies seem to be less effective. In 2007, researchers tested some of these, and found that urinating on a jellyfish sting may actually increase pain, whilst lemon juice and shaving cream are ineffective. Avoiding the sea after a sting is good advice, as salt water can make it more painful. Dousing the area in water whilst barbs are still present is also not recommended as it may cause more venom to be released.

So, the advice for jellyfish stings is to remove the barb, bathe in vinegar, apply warm packs and take anti-inflammatories if needed. For sea urchin stings, avoid pulling out the spines, but again, use vinegar, hot packs and anti-inflammatories.

Get your dancing shoes on

A UK study has shown that dance classes are a great way to maintain health and wellbeing in later life.

Think you're too old to dance? Think again. A two-phase research project run by the Royal Academy of Dance (RAD) in the UK in 2013 and 2016, called the 'Dance for Lifelong Wellbeing Project', has shown that there really is no age barrier when it comes to discovering – or rediscovering – the joy of movement. The research revealed that you can dance, whatever your age; and that taking regular dance classes when you're older can really help you stay fit and healthy, in mind as well as body.

We often associate dancing with children and younger adults and, if you're a lot older than this, you may think it's something you can no longer do. But the idea behind the project was to challenge this belief, so the RAD introduced a 12-week dance programme for the over 50s to demonstrate that people of any age can benefit from a good boogie. Of those who took part, 80% were aged 75 or more, another ten were over 90 years old, and the oldest celebrated his 102nd birthday while on the programme. Many who took part initially said that they felt too old to take a dance class, or were unsure if they would be able to dance, and were delighted to find out they were wrong. Instead, they experienced a significant increase in their self-esteem and confidence and discovered they really could still hit the dancefloor, even if they had limited mobility or other health restrictions.

The initial project was so successful that a second phase was planned in order to delve deeper into the findings and take the research further, with the results published in 2017. The second phase looked at the effect of dance

on quality of life overall as well as general health and wellbeing. It confirmed that taking up dance classes in later life really can help you enjoy life more, along with improving your physical and mental health. Specifically, general energy levels were increased among the learners; and balance and co-ordination was better, leading to a reduced risk of falling – something senior citizens are particularly vulnerable to. The classes also encouraged a more positive outlook on life, as it was such a social activity and the dancers had a lot of fun. Interestingly, the fact that they had tried something new also made them more confident in trying other new activities.

RAD has now set up regular classes for over 55's to encourage this population to keep moving; and places are in demand. So if you've ever thought you can't dance, you're too old to dance, or that dancing is not for you, think again and give it a try. Advancing in years need not be a reason to avoid doing something you've enjoyed in the past, especially if it keeps you mentally and physically fit and healthy.

Preventing ingrowing toenails

Ingrowing toenails can be extremely painful, causing redness, swelling and infection.

In the most severe cases, an operation which removes all or part of the affected nail may be needed to help clear the infection and relieve pain. This should be a last resort, as complications including chronic pain can follow the procedure. Many ingrowing toenails can be avoided or treated by following some really simple advice.

An ingrowing toenail occurs when the corner of a growing nail (usually on the big toe) 'digs in' to the skin of the corner of the toe, breaking the skin and causing pain as it grows. The damaged skin is then more susceptible to infection, particularly if the area is moist and warm – conditions which bacteria love! This goes some way to explain why ingrowing toenails are more frequent in adolescents, whose feet can be sweaty and may be enclosed in trainers for much of the day.

Preventing this painful condition can be pretty straightforward. Firstly, avoid or reduce time in hot, sweaty shoes – especially if they are tight fitting. Secondly, and perhaps most crucially, take care over cutting toenails. The corner of the toenail should be left 'square', with the tip jutting just beyond the skin. Toenails shouldn't be 'rounded' at the corners, as this means the growing area will dig into the skin as it advances. If a toe starts to become red and sore, soak it in warm water and gently push the skin away from the nail. This can help prevent the problem progressing.

If these measures fail, and especially if there are other medical conditions such as diabetes or problems with immunity, then medical help should be sought. However, using these simple tips should help avoid most problems with ingrowing toenails.

FEES

Schedules are available at reception. Account fees apply if payment is not made on the day. Children under 16, concession card holders and DVA card holders may be bulk billed for some services at our discretion. Fees may be paid by cash, EFTPOS, cheque or credit card. Medicare Online claiming is available for privately billed patients.

All new patients incur private, scheduled fees (Medicare BB applies). If you are a child under 16, on a HCC or PMS, BB may apply after that. Private fees also apply for services outside of consultations e.g., repeat prescriptions, copies of pathology reports. Private fees apply for consultations not eligible for a Medicare rebate e.g., commercial driving licence for buses/HGV, travel advice, health screening.

SPECIALISTS & OTHER HEALTH PROVIDERS

Tell your doctor if you prefer a particular Pathology, X-ray or other health provider. A consultation is always required for referrals to specialist and other health providers. Doctors cannot issue "back dated" referrals. Other health providers may charge fees not covered by Medicare rates.

PERSONAL HEALTH INFORMATION

Your medical record is confidential and it is our policy to ensure it is only available to authorised members of staff. Ask at reception for statements on **Collection of Patient Information and Practice Privacy Policy**; or an **Application for Access to Medical Records**.

FORM COMPLETION

A consultation is required for completion of forms including Travel or Taxi Subsidy, Disability Parking, Private Insurance, Centrelink and Hearing. Please inform us when making an appointment. Medicare rebates may not apply.

PRACTICE NURSE CLINICS

An initial appointment with your doctor is also needed.

- Wound care (you may be asked to buy suitable dressings at the pharmacy)
- Vaccinations (eg, children, overseas travel, Gardasil, Flu)
- Annual Health Assessment for over 75's
- Annual Health check for patients with intellectual disability
- Preventative health checks for patients of Aboriginal/Torres Strait Islander descent
- Counselling to assist stopping smoking
- Asthma action plans
- Diabetes checks
- Management plan for chronic conditions
- Coordination of Team Care Arrangements (TCA) – including some Medicare rebates
- Mental Health Plans allowing Medicare rebates for psychology sessions
- Pap smear with women's preventative health check
- Contraceptive and sexual health advice
- 45–50 y.o. preventative health checks
- Domestic violence counselling

COMPLAINTS

We are committed to patient care and your satisfaction is important to us. If you are unhappy with any of our services, we would appreciate your feedback.

Anonymous complaints forms are provided next to the suggestion box at reception. If your complaint needs immediate attention, please ask for the Practice Manager, Heide Grimson, who will be happy to assist.

If the matter is not resolved to your satisfaction, you may contact the **Office of the Health Ombudsman**, PO Box 13281 George Street, Brisbane. Qld. 4003, ph: 133646. email: info@oho.qld.gov.au
